

Alternative for Dice

Full Rebuild Prompt — Exact Specification

React · TypeScript · Vite · Tailwind CSS v4 · Outfit Font

1. OVERVIEW

What to build

A single-page React + TypeScript + Vite web application called "Alternative for Dice". No backend is required. The app is a card-based dice replacement: face-down cards hide numbers, the player flips one per turn to reveal it, and after all cards are used the deck resets. Every number appears exactly once per shuffle — giving fair, non-repeating results unlike real dice.

Stack

- React 18 + TypeScript
- Vite (built tool)
- + dev server)
- Tailwind CSS v4 (via

2. COLOUR SYSTEM & THEME

Defined as CSS custom properties (HSL) in :root. There is no light mode — both :root and .dark use the same values.

--background hsl(270, 50%, 11%) — Deep rich violet page background
--foreground hsl(0, 0%, 98%) — Near-white text
--card hsl(270, 40%, 16%) — Card surface / UI panel background
--card-foreground hsl(0, 0%, 98%)
--card-border hsl(270, 30%, 25%)
--primary hsl(330, 100%, 55%) — Vibrant magenta/pink — buttons, borders, glows
--primary-foreground hsl(0, 0%, 100%) — White text on primary
--secondary hsl(190, 100%, 50%) — Electric cyan — revealed number colour, "All Revealed" state
--secondary-foreground hsl(270, 50%, 11%) — Dark text on secondary
--muted hsl(270, 30%, 20%)
--muted-foreground hsl(270, 20%, 70%) — Subdued text
--accent / --ring hsl(330, 100%, 55%) — Same as primary
--radius 1rem — Base border-radius

Body background overlay

Two fixed radial gradients layered over the background colour (background-attachment: fixed):

4.1 HEADER

<h1> "Alternative for Dice"

Font weight font-black (900)

Size text-4xl mobile / text-5xl md+

Colour white

Other tight letter-spacing (tracking-tight), drop-shadow-md, text-center

<p> "A card-based alternative to rolling dice. Flip one hidden card per turn to reveal a number — each value appears exactly once, giving you fair, shuffled results every time."

Colour muted-foreground

Size text-sm mobile / text-base md+

Width max-w-md, centred, leading-relaxed

5. MODE SELECTOR

Two side-by-side toggle buttons (flex row, gap-3). Default active: Set 2.

Button styles

Base: px-5 py-3, rounded-xl, border-2, font-bold, flex-col items-center, gap-0.5, transition-all duration-300, cursor-pointer.

Inactive: border-muted-foreground/30, bg-card, text-muted-foreground. On hover: border-primary/50, text-white.

Active: border-primary, bg-primary/20, text-white, scale-105, box-shadow: 0 0 16px rgba(255,51,102,0.4).

Switching modes immediately resets pickedThisTurn, poppingId, and isShuffling=true, then after 400 ms creates a new shuffled deck, then after another 400 ms sets isShuffling=false.

6. STATUS BOX

A pill (rounded-full) container with border-2, px-8 py-3, font-bold text-lg, transition-all duration-500. Three visual states:

State A — idle (no card picked this turn)

8. CARDS GRID

Grid layout

Set 1 (6 cards): grid-cols-2 (mobile), grid-cols-3 (sm+).

Set 2 (11 cards): grid-cols-2 (mobile), grid-cols-3 (sm), grid-cols-4 (md+).

Gap: gap-4 mobile, gap-6 md+. justify-items: center.

Card wrapper div

Width w-full, max-w-[160px]

Aspect ratio aspect-[3/4]

Perspective perspective-1000
(perspective: 1000px)

Border radius rounded-2xl

Position relative

Cursor + opacity:

transform: translateY(±20px) translateX(±20px) scale(0.9) rotate(±5deg) [random values each

Shuffle animation (while isShuffling=true)

Each card goes back to: translateY(0) translateX(0) scale(1) rotate(0deg)

Each card gets a transitionDelay of index * 30ms. Its inline style temporarily offsets the card:

```
transform: 20px 90px rgba(255, 98, 220, 0.19), 0 34px light-magenta halo */
```

```
0 0 20px 6px rgba(255, 98, 220, 0.5) /* mid magenta bloom */
```

```
0 0 20px 6px rgba(255, 98, 220, 0.3) /* wide cyan aura */
```

```
backface-visibility: hidden; -webkit-backface-visibility: hidden; }
```

```
rotate-y-180 { transform: rotateY(180deg); }
```

transition-duration: 0.65s; div with transform-style: preserve-3d. This is the 3D context. Both faces are

transition-timing-function: cubic-bezier(0.2, 0.8, 0.2, 1);

Flip transition on the inner div:

When card.isFlipped === true the inner div gets class rotate-y-180. When card is available (not locked) it gets

hover: translate-y-2 for a lift effect.

10. CARD BACK

The back face: position absolute, inset-0, backface-hidden, rounded-2xl, shadow-xl, border-4 border-primary/40, overflow-hidden. Background is a hot-pink seigaiha (fish-scale / overlapping circles) CSS-only

```
    hsl(320,100%,45%) 33%, hsl(330,100%,55%) 30%,  
    hsl(330,100%,55%) 45%, hsl(320,100%,45%) 46%,  
    hsl(320,100%,45%) 49%, transparent 50%, transparent);  
    background-size: 50px 50px;  
}
```

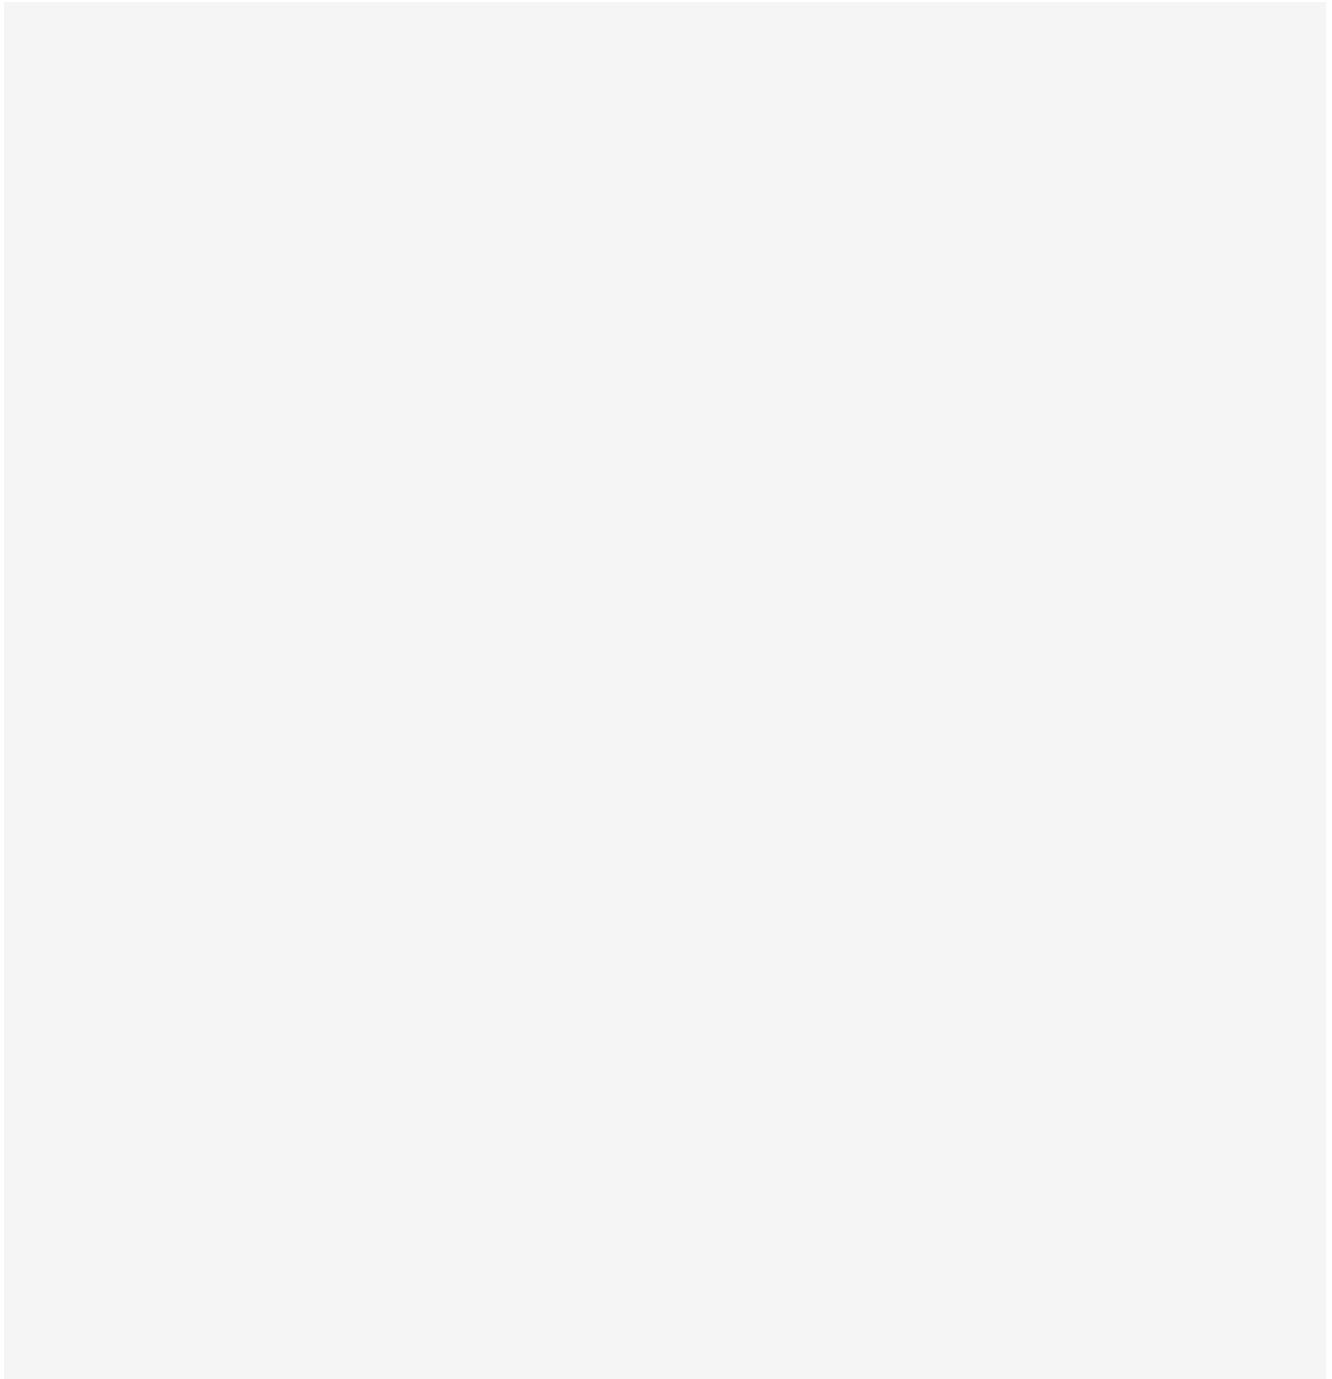

pattern.

Base colour hsl(330, 100%, 55%) — magenta

Scale colour hsl(320, 100%, 45%) — slightly darker pink

background-size 50px 50px

The pattern is composed of 5 layered radial-gradient calls:

```

<div class="perspective-1000 relative ...">      !• wrapper (2D)
  <div class="transform-style-3d rotate-y-180 ..."> !• 3D context
    <div class="backface-hidden ...">BACK</div>
    <div class="backface-hidden rotate-y-180 ...">FRONT</div>
  </div>

```

15. CRITICAL IMPLEMENTATION NOTES

3D animation isolation (most important)

The ripple div MUST be a sibling of the 3D flip container, not a child of it. Any element inside a transform-style: preserve-3d parent participates in 3D space, which means scale() and opacity animations fight against rotateY(180deg) animations inside the 3D container. Because it only animates scale and opacity on a span inside the front face — it does not re-apply rotateY, so there is no conflict.

One card per turn enforcement

Prevent clicking the gate. Once true: handleFlip returns early for any click. All unflipped cards get opacity-40 and cursor-not-allowed as the ISLocked derived value.

```

!• 650ms: setPoppingId(id) - starts reveal-ripple + number pop
!• 900ms: setPoppingId(null) - removes both animation classes

```

Animation timing chain

Shuffle stagger timing

Each card wrapper uses inline style transitionDelay = index * 30ms during isShuffling. This creates a cascade wave effect where cards animate in sequence rather than all at once.

Math.random() in style prop

The shuffle class uses Math.random() inside the inline style object during render. This is intentional — each render during isShuffling regenerates random offsets, producing the "scatter" animation. No useRef or useMemo is needed here; <random> is the point.

```

@custom-variant dark (&:is(.dark *));
@theme inline { /* CSS variable mappings */ }

```

Tailwind v4 config

No tailwind.config file is needed. Configuration is done entirely in CSS. Custom utilities like perspective-1000, transform-style-3d, backface-hidden, and rotate-y-180 are written as plain CSS classes, not Tailwind utilities.
